The SQL Server in my installation is using all my memory.

Issue:

The SQL Server used by My Movies in My Movies for Windows Media Center, My Movies Collection Management or My Movies for Windows Home Server is using all available memory on your machine.

Cause:

Microsoft SQL Server is designed to by default to always use as much memory as the system have available, to improve the performance of the database server. The memory is however freed instantly to the system at the time other applications requires it, and it is therefore not in any way problematic for the performance of your machine that SQL Server is using all the memory available in your system. You can see how this works by opening a lot of applications on your machine and then see how the memory usage of the SQL Server drops along with other applications using it.
